

# LINEAR GRAPHS

MINI-LESSON

For the Linear Graphs key concept

## Summary

Students explore the language and visual representations of linear graphs by matching up terms with diagrams.

**Suitable for 2-6 students**

**Length 30 min** (approximately)

## Lesson Preparation

- **Matching Sets** ([download](#)) – one per pair of students  
*[Note: either cut up the sets of cards prior to running the activity or set aside time during the activity for students to do this.]*

### Optional:

- **Answers for Matching Sets** ([download](#)) – one for teacher reference
- **Scissors** – one pair for each student
- **Computer/Device with internet** – for looking up terminology, if needed

## LEARNING INTENTIONS

This activity helps students to:

- Understand and use language involving the distance, mid-point and gradient of linear graphs.
- Understand and use language involving parallel and perpendicular lines.

## CURRICULUM LINKS

- Finding the distance between two points on a Cartesian Plane (ACMNA214)
- Finding the gradient and mid-point of a line (ACMNA294)
- Working with parallel and perpendicular lines (ACMNA238)

## AFTER THE LESSON

In later lessons, students can further embed their understanding of terminology by:

- developing a glossary that can be easily referred to.
- creating a mind map showing how different terms relate to each other.

<b>INTRODUCTION</b>	<b>3 MINUTES</b>
<p><b>Explain to students that in this activity they will be exploring the language of linear graphs.</b></p> <p>Ask students, and briefly discuss:</p> <ul style="list-style-type: none"> <li>• What is a linear graph?</li> <li>• Why is it important to have a good understanding of mathematical language?</li> </ul>	<p><b>Whole group:</b></p> <p>Sharing ideas with the group.</p>
<b>DEMONSTRATION</b>	<b>10 MINUTES</b>
<p>Give each pair of students a set of cards. For each term, students need to identify the matching diagram. Note that for some terms, students will need to write in a definition of their own.</p> <p>If helpful for getting started, as a group match up one term with its diagram and discuss why the match makes sense.</p> <p><b>Prompt student thinking: As students work, ask scaffolding questions or give prompts e.g.:</b></p> <ul style="list-style-type: none"> <li>• Choose one diagram. What does it show? Which term could it be/couldn't it be?</li> <li>• How can you convince me that the match you have is correct? Is there another way you can check?</li> <li>• Look up terms online for any definitions you are completely stuck on.</li> </ul>	<p><b>In pairs:</b></p> <p>Match each of the eight terms with a diagram. Fill in any blank definitions.</p>
<b>DISCUSSION</b>	<b>5 MINUTES</b>
<p>Go through the answers as a group, getting students to explain their reasoning for each match. Check that there is agreement on the definitions that students have written. Are some definitions more precise than others?</p>	<p><b>Whole group:</b></p> <p>Discuss solutions.</p>
<b>DIG DEEPER</b>	<b>10 MINUTES</b>
<p>Explain to students that not only is it important to understand each of these terms, but they become even more meaningful when you consider how they relate to one another.</p> <p><b>As a final activity:</b> go through each term and, one at a time, ask students for another term that relates to it. For example:</p> <p>Teacher: "The term I've chosen is 'Gradient'. What is another term that relates to it? How do they relate?"</p> <p>Student: "'Linear Graph' is related, since the gradient describes how steep a line on a Cartesian Plane is."</p> <p>This can be a good opportunity to see if students have another way of describing the relationship, or if there is any part of their peer's description that they would change.</p>	<p><b>In pairs:</b></p> <p>Contribute ideas about the relationship between terms.</p>
